1. INTRODUCTION

1.1 Project Overview

The need for effective and efficient monitoring, evaluation and control of water quality in residential area has become more demanding in this era of urbanization, pollution and population growth. Ensuring safe water supply of drinking water is big challenge for modern civilization. Traditional methods that rely on collecting water samples, testing and analyses in water laboratories are not only costly but also lack capability for real-time data capture, analyses and fast dissemination of information to relevant stakeholders for making timely and informed decisions. In this paper, a real time water quality monitoring system prototype developed for water quality monitoring in Residential home is presented. The development was preceded by evaluation of prevailing environment including availability of cellular network coverage at the site of operation. It detects water temperature, dissolved oxygen, pH, and electrical conductivity in real-time and disseminates the information in graphical and tabular formats to relevant stakeholders through a web-based portal and mobile phone platforms. The experimental results show that the system has great prospect and can be used to operate in real world environment for optimum control and protection of water resources by providing key actors with relevant and timely information to facilitate quick action taking.

1.2 Purpose

Monitoring data is used to determine whether or not pollution regulations are being complied with. From oil spills and radiation leaks to floods and mass erosion, water quality monitoring data is a must when developing emergency strategies. To protect, restore, and enhance environmental quality towards good public health, environmental integrity, and economic viability. Monitoring is essential to ensure that the intended project objective can be achieved within the given time frame following the activities as planned to be carried out by project personnel. Quality control consists of evaluating 2 main processes during data collection. One is instrumentation control, which monitors the instrument used to collect data. The other is population quality control, which monitors the sample to make sure it is representative of the target population.

2.LITERATURE SURVEY

Ahmed Abbas Fadel , Mohamed Ibrahim Shujaa, Department of Computer Engineering Techniques, Middle Technical University (MTU), Iraq proposed a Water treatment monitoring systems are presently divided into manual and dynamic systems. Due to, the constant changes in water, either due to seasonal changes in water chemistry or due to the operative conditions of the industrial environment, the dynamic systems have to be utilized by the water manufacturers. However, water is very beneficial for life and human health, therefore to reduce the endangerment of pollution, by improving and increasing the plant operation in addition to production. This paper suggests a new technique for water factory manufacturers by adopting wireless sensor nodes. The monitor node connected with a microcontroller device using Esp32 as transmitter and receiver nodes. The node sends its statues over the wireless network utilizing a defined internet protocol (IP). The proposed system shows its effectiveness in water monitoring systems through synchronous water monitoring and simple configuration compared to traditional systems

Kartik Maheshwari , Adrija Chakraborty proposed a Monitoring the quality of water and its proper management is crucial for any industrial and economic application. The global shortage of water demands a sustainable solution to optimize its usage. The Internet of Things provides a robust and cost-effective solution for real-time monitoring of various parameters of water. The paper aims to implement an intelligent water quality monitoring system with the aid of IoT. The proposed system was successfully implemented to determine the turbidity, TDS, flow rate and the level of water for a given sample. The data obtained from the sensors are uploaded to the ThingSpeak dashboard for online monitoring purpose. Besides, an SMS alert is sent to the user whenever the turbidity and TDS values have crossed the threshold limit defined for good quality water

Varsha Lakshmikantha, Anjitha Hiriyanagowda, Akshay Manjunath, Aruna Patted, Jagadeesh Basavaiah* , Audre Arlene Anthony a Department of Electronics and Communication Engineering, Vidyavardhaka College of Engineering, Mysuru, India proposed a Pollution of water is one of the main threats in recent times as drinking water is getting

contaminated and polluted. The polluted water can cause various diseases to humans and animals, which in turn affects the life cycle of the ecosystem. If water pollution is detected in an early stage, suitable measures can be taken and critical situations can be avoided. To make certain the supply of pure water, the quality of the water should be examined in real-time. Smart solutions for monitoring of water pollution are getting more and more significant these days with innovation in sensors, communication, and Internet of Things (IoT) technology. In this paper, a detailed review of the latest works that were implemented in the arena of smart water pollution monitoring systems is presented. The paper proposes a cost effective and efficient IoT based smart water quality monitoring system which monitors the quality parameters uninterruptedly. The developed model is tested with three water samples and the parameters are transmitted to the cloud server for further action

Spoorthi L , Nikhitha Kashyap , Rajatha , Priyanka M , Prof. Bhargavi K Department of Electronics and Communication Engineering, Vidyavardhaka College of Engineering, Mysuru, India proposed a Wireless communication developments are creating new sensor capabilities. The current developments in the field of sensor networks are critical for environmental applications. Internet of Things (IoT) allows connections among various devices with the ability to exchange and gather data. IoT also extends its capability to environmental issues in addition to automation industry by using industry 4.0. As water is one of the basic needs of human survival, it is required to incorporate some mechanism to monitor water quality time to time. Around 40% of deaths are caused due to contaminated water in the world. Hence, there is a necessity to ensure supply of purified drinking water for the people both in cities and villages. Water Quality Monitoring (WQM) is a cost-effective and efficient system designed to monitor drinking water quality which makes use of Internet of Things (IoT) technology

Vennam Madhavireddy, B. Koteswarrao 1PG Student, Department of Electronics and Communication Engineering, Marri Laxman Reddy Institute of Technology and Management, Hyderabad, India. Department of Electronics and Communication Engineering, Marri Laxman Reddy Institute of Technology and Management, Hyderabad, India. The economical and effective system of water quality observation is the most robust implementation of impure water. Drinking water could be precious

for all people as water utilities face more challenges. These challenges arise due to the high population, fewer water resources, etc. So, different methods are used to monitor in the real-time water quality. To make sure that safe distribution of water is done, it must be observed in real time for a new method in the “Internet of Things (IoT)” based water quality has been projected.

Real time water quality observation is examined by data acquisition, method, and transmission with an increase in the wireless device network method in the IoT. Microcontroller and the processed values remotely to the core controller ARM with a WI-FI protocol are used to interface the measured values from the sensors. This projected the water quality observation interface sensors with quality observation with IOT setting. WQM selects parameters of water like temperature, pH level, water level and CO₂ by multiple different device nodes. This methodology sends the information to the web server. The data updated at intervals within the server may be retrieved or accessed from anyplace within the world. If the sensors do not work or get into abnormal conditions, then a buzzer will be ON.

A.N.Prasad, K. A. Mamun, F. R. Islam, H. Haqva School of Engineering and Physics University of the South Pacific Laucala, Fiji Islands — Nowadays Internet of Things (IoT) and Remote Sensing (RS) techniques are used in different area of research for monitoring, collecting and analysis data from remote locations. Due to the vast increase in global industrial output, rural to urban drift and the over-utilization of land and sea resources, the quality of water available to people has deteriorated greatly. The high use of fertilizers in farms and also other chemicals in sectors such as mining and construction have contributed immensely to the overall reduction of water quality globally. Water is an essential need for human survival and therefore there must be mechanisms put in place to vigorously test the quality of water that made available for drinking in town and city articulated supplies and as well as the rivers, creeks and shoreline that surround our towns and cities. The availability of good quality water is paramount in preventing outbreaks of water-borne diseases as well as improving the quality of life. Fiji Islands are located in the vast Pacific Ocean which requires a frequent data collecting network for the water quality monitoring and IoT and RS can improve the existing measurement. This paper presents a smart water quality monitoring system for Fiji, using IoT and remote sensing technology.

S. Nalini Durgal , M. Ramakrishna, G. Dayanandam Research Scholar, School of Sciences, Sri Padmavathi Mahila Visvavidyalayam, Tirupathi. India Water is the most precious and valuable resource. With the increase in population, availability of clean water has become a problem. Today, water-supply department as well as common man is facing problems in real-time operations like water distribution and conservation efficiency. Therefore it is important to find a solution to address water wastage through efficient water monitoring and control system. In this paper, the problem is solved through autonomous water tank filling system using IoT where in embedded sensors are used to monitor the tank status along with some other key attributes like power supply, incoming water supply in real-time. Our intention of this research work was to establish a flexible, economical, easy configurable and most importantly, a portable system which can solve our water wastage problem along with saving the electrical energy. This enhances the efficiency of water distribution and reduces wastage.

Sefali Surabhi Rout¹ , Hitesh Mohapatra^{2*} , Rudra Kalyan Nayak³ , Ramamani Tripathy⁴ , Dhiraj Bhise ⁵ , S.P.Patil⁶ , Amiya Kumar Rath⁷ ^{1,2*,7} Department of CS&E, Veer Surendra Sai University of Technology, Burla, Sambalpur- 768018, OD, India ^{2*,3}Department of Computer Science and Engineering, Koneru Lakshmaiah Education Foundation, Vaddeswaram-522502, Guntur, AP, India

Conservation of water in urban areas is an ongoing challenge in which technology like IoT and WSN is playing a very crucial role. Studies show that 54% of India is facing absolute water scarcity or high economic water stress. To address this challenge the forecasting and monitoring of water consumption along with effective management and distribution are important. This paper implements the seasonal threshold constraint on water distribution which conserves a significant amount of water loss over uniform supply around the year by considering end-user behavior changes according to the season. The results have been confirmed through simulation of the proposed algorithm Weather-based Smart Water Monitoring (WSWM). This extensive study only suggests a possible alternative approach to design the water distribution system to conserve water. However, more work is required for achieving an optimized approach for sustainable urban water management

Smart Meter for Water Utilization using IoT D.Anandhavalli¹, K.S. Sangeetha², V. Priya Dharshini³, B. Lukshana Fathima proposed Smart water meter is a device that measures the amount of water consumed by householders who have the device fitted within their premises. Water conservation is a big issue in many apartments. A common meter is fitted and cumulative consumption amount is shared among households where they are being charged more than what is to be paid. There are several idea to overcome this issue. In this paper we have proposed a solution to this issue in which a device is used to calculate the flow rate and quantity of water consumed by the householders and send it to the cloud to monitor the consumption of water.

cili Yanga ^{*}, Shuang-Hua Yang^b , Ewa Magierac , Wojciech Froelich^c , Tomasz Jachc , Chrysi Laspidou^{As} proposed the water resource is becoming scarce, conservation of water has a high priority around the globe, study on water management and conservation becomes an important research problem. People are increasingly becoming more individual households, which tend to be less efficient, requiring more resources per

capita than larger households. In order to address these challenges, this paper presents the achievements of monitoring domestic water consumption at the appliance level and intervening people's water usage behavior which have been made in ISS-EWATUS, an European Commission funded FP7 project. The water amount consumed by every household appliance is wirelessly recorded with the exact consumption time and stored in a central database. People's water consumption behavior is likely affected by the real-time water consumption awareness, instant practical advices regarding water-saving activities and classification of water consumption behavior for individuals, all of which are provided by a decision support system deployed as a mobile application in a tablet or any other mobile devices. Only the enhanced water consumption awareness is presented in this paper due to the space limitation. The integrated monitoring and decision support system has been deployed and in use in Sosnowiec in Poland and Skiathos in Greece since March 2015. The domestic water consumption monitoring system at appliance level and the local DSS for affecting people's water consumption behavior are innovative and have little seen before according to the knowledge of the authors.

1.3 Existing problem

Rivers and streams drain water that falls in upland areas. Moving water dilutes and decomposes pollutants more rapidly than standing water, but many rivers and streams are significantly polluted all around the world. Water pollution has very negative effects on public health. A lot of diseases result from drinking or being in contact with contaminated water, such as diarrhea, cholera, typhoid, dysentery or skin infections. In zones where there is no available drinking water, the main risk is dehydration obviously.

Problem Statement Definition

Due to the fast growing urbanization supply of safe drinking water is a challenge for the every city authority. Water can be polluted any time. So the water we reserved in the water tank at our roof top or basement in our society or apartment may not be safe. Still in India most of the people use simple water purifier that is not enough to get surety of pure water. Sometimes the water has dangerous particles or chemical mixed and general purpose water purifier cannot purify that. And it's impossible to check the quality of water manually in every time. So an automatic real-time monitoring system is required to monitor the health of the water reserved in our water tank of the society or apartment. So it can warn us automatically if there is any problem with the reserved water. And we can check the quality of the water anytime and from anywhere. By keeping this mind we designed this system especially for residential areas.

3. IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

3.2 Ideation & Brainstorming

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

- 10 minutes to prepare
- 1 hour to collaborate
- 14 people recommended

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

- 1. Team planning: Before the session, assign roles and responsibilities to each team member (facilitator, scribe, etc.).
- 2. Writing pad: Have a large sheet of paper or a digital workspace for brainstorming ideas.
- 3. Open to all: Encourage everyone to contribute ideas, no matter how small or silly they seem.

MEMBERS OF THE IDEATION PROCESS:

TEAM ID : PTN02ZZTMD16162

TEAM LEAD : SANGAVI N

TEAM MEM 1: SAKTHI PRIYA B

TEAM MEM 2: RAVILLA NISHA

TEAM MEM 3: PREETHA S

TEAM MEM 4: HARSHAVARTHINI R

TODAY'S DISCUSSION TOPIC:

Ideas for monitoring and solving the contaminated river water near agriculture fields

Define your problem statement

What problem are you trying to solve? Frame your problem as a clear, high-level statement. This will be the focus of your brainstorm.

PROBLEM STATEMENT

Excessive use of fertilizers and pesticides on agricultural fields leads to the contamination of nearby rivers. This contamination poses a significant health risk to the community living downstream. The problem is exacerbated by the lack of proper waste management practices in the area.

GOALS

- 1. To monitor the water quality in the river near agricultural fields.
- 2. To identify the sources of contamination and implement measures to reduce it.
- 3. To provide a real-time alert system to the community when the water quality is poor.

Brainstorm

Write down any ideas that come to mind that address your problem statement.

Group ideas

Discuss your ideas with your team and group them into categories. This will help you identify common themes and areas for further exploration.

Sort ideas

Rank your ideas based on their feasibility and importance. This will help you prioritize your ideas and focus on the most promising ones.

Final ideas

Choose the ideas that you want to pursue further. These will be the focus of your next steps.

real time river water monitoring and control systems

sensor based

- 1. pH, turbidity, temperature sensors connected with wireless network.
- 2. IoT module to collect and transfer water quality data to mobile application.
- 3. GPS for tracking the location of the water quality monitoring stations.
- 4. Real-time data monitoring and alert system.
- 5. Data storage and analysis for water quality trends.
- 6. Mobile application for water quality monitoring and alert system.
- 7. Cloud-based data storage and analysis.
- 8. Real-time data monitoring and alert system.
- 9. Data storage and analysis for water quality trends.
- 10. Mobile application for water quality monitoring and alert system.

manual work

- 1. Manual collection of water samples for pH, turbidity, and temperature measurement.
- 2. Manual recording of water quality data in a logbook.
- 3. Manual analysis of water quality data.
- 4. Manual alert system for water quality monitoring.
- 5. Manual data storage and analysis.
- 6. Manual monitoring and alert system.
- 7. Manual data storage and analysis.
- 8. Manual monitoring and alert system.
- 9. Manual data storage and analysis.
- 10. Manual monitoring and alert system.

Finalize

Your team should decide on the most important ideas to pursue. These will be the focus of your next steps.

After your collaboration

You can report the results of your session to your team members. This will help them understand the ideas that were generated and the progress that was made.

Quick and easy

- 1. Start the session by introducing the topic and the goals.
- 2. Brainstorm ideas for 10 minutes.
- 3. Group and sort ideas.
- 4. Choose the final ideas.

Keep moving forward

- 1. Assign tasks to team members.
- 2. Monitor progress and provide feedback.
- 3. Celebrate success and learn from failure.

Importance

Real-time monitoring and control systems for river water quality are essential for protecting public health and the environment. They provide a proactive approach to water quality management, allowing for early detection and response to contamination events.

Feasibility

The proposed system is feasible and can be implemented using existing technology. It provides a cost-effective solution for monitoring and controlling river water quality, ensuring the safety of the community living downstream.

After your collaboration

You can report the results of your session to your team members. This will help them understand the ideas that were generated and the progress that was made.

Quick and easy

- 1. Start the session by introducing the topic and the goals.

- 3. Celebrate success and learn from failure.

Importance

Real-time monitoring and control systems for river water quality are essential for protecting public health and the environment. They provide a proactive approach to water quality management, allowing for early detection and response to contamination events.

Feasibility

The proposed system is feasible and can be implemented using existing technology. It provides a cost-effective solution for monitoring and controlling river water quality, ensuring the safety of the community living downstream.

3.3 Proposed Solution

The main aim is to develop a system for continuous monitoring of river water quality at remote places using wireless sensor networks with low power consumption, low-cost and high detection accuracy. pH, conductivity, turbidity level, etc. are the limits that are analysed to improve the water quality.

Following are the aims of idea implementation

- (a) To measure water parameters such as pH, dissolved oxygen, turbidity, conductivity, etc. using available sensors at a remote place.
- (b) To assemble data from various sensor nodes and send it to the base station by the wireless channel.
- (c) To simulate and evaluate quality parameters for quality control.
- (d) To intimate to an authorized person routinely when water quality detected does not match the pre-set standards, so that, necessary actions can be taken.

In the proposed architecture, each water reservoir will be attached with a sensor node equipped with a set of sensor probes capable of measuring the parameters like pH, turbidity etc. According to the specifications of the sensor probes and the processor board of the sensor the signal conditioning circuit will be designed to generate the sensor output to the processor board through Analog to Digital Converter. The processor board processes the data according to the quality specifications and transmits to the central server through the transceiver. The measured data in each of the reservoir shall be sent to the central server through the respective transceivers either directly or indirectly through other sensor or repeater nodes.

4. REQUIREMENT ANALYSIS

4.1 Functional requirement

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	<u>Arduino</u> (control system)	Sensors are interfaced to Arduino and it collects measurements data periodically from sensors.
FR-2	WSN Sensor	Multiple sensor nodes installed for the detection of pH, temperature, dust particles, turbidity.
FR-3	Software Design Requirements	WSN requires IoT platform which requires Neural Network Model to classify water quality as Good <u>Or</u> Bad. IoT integrated big data analytics to store data in cloud and <u>analyze</u> it constantly.
FR-4	LCD/PC/Mobile display	Displays the resulting sensed pH, temperature, turbidity. <u>If, acquired</u> value > Threshold value, then comment=BAD. If, acquired value < Threshold value, then comment=GOOD.

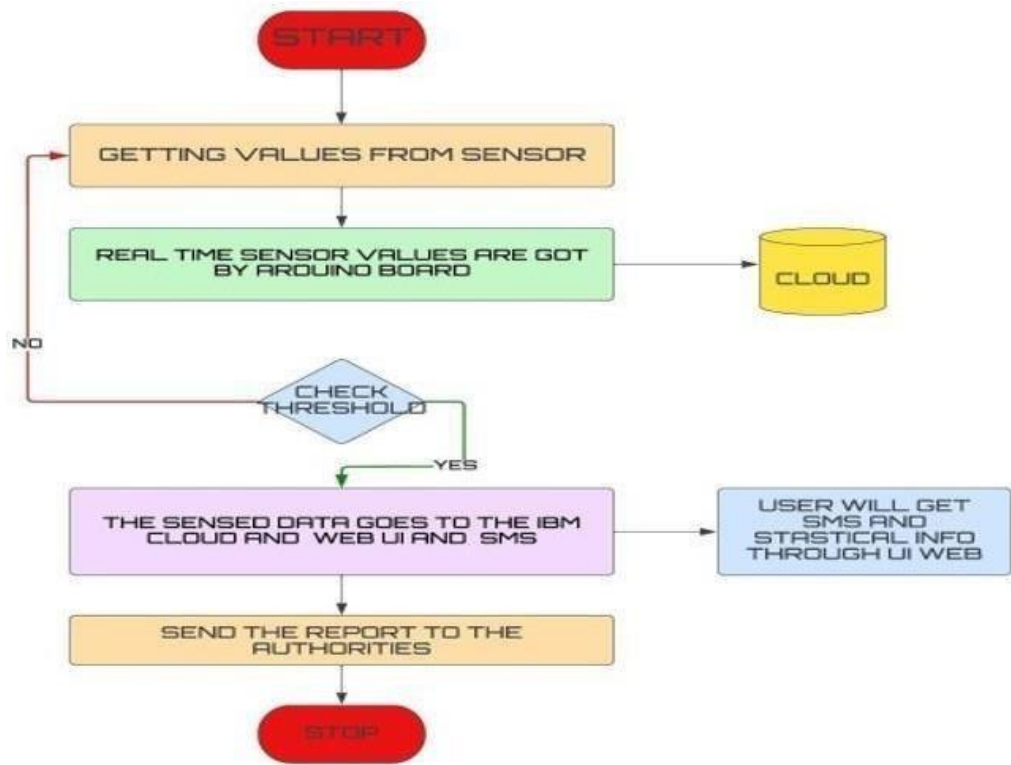

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	It is important to monitor water quality to ensure that, it is safe for humans to drink it as well as for wild life and marine life and to understand environmental impacts and to not harm sea life.
NFR-2	Security	The IoT networks are incredibly safe and communication speed is also high. The technology comfortably resolves all the issues.
NFR-3	Reliability	The water quality and monitoring system is reliable and <u>it's</u> output can be assured. Since standardized hardware components and software designs are used.
NFR-4	Performance	Real-time quality of water is executed and <u>alertring</u> the authorities if water quality is not good.
NFR-5	Availability	The monitoring system is made available for use at any time with accuracy.
NFR-6	Scalability	The system with high frequency, high mobility and low powered and cost-effective.

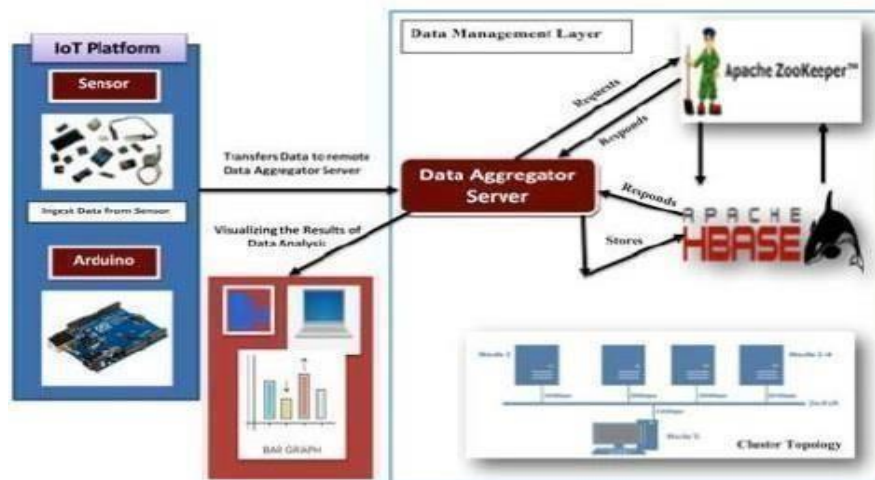

5. PROJECT DESIGN

5.1 Data Flow Diagrams

5.2 Solution & Technical Architecture

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- **Arduino MegaBoard.**

Arduino is an open-source electronics prototyping platform based on flexible, easy-to-use hardware and software. Its intended for artists, designers, hobbyists, and anyone interested in creating interactive objects or environments. Or more simply, you load on some code and it can read sensors, perform actions based on inputs from buttons, control motors, and accept shields to further expand its capabilities. Really, you can do almost anything.

All Arduino boards have one thing in common: they are programmed through the Arduino IDE. This is the software that allows you to write and upload code. Beyond that, there can be a lot of differences. The number of inputs and outputs (how many sensors, LEDs, and buttons you can use on a single board), speed, operating voltage, and form factor are just a few of the variables. Some boards are designed to be embedded and have no programming interface (hardware) which you would need to buy separately. Some can run directly from a 3.7V battery, others need at least 5V.

Check the chart on the next page to find the right Arduino for your project.

Fig 2 :Arduino mega board

- **liquid-crystal display (LCD):**

It is a flat-panel display or other electronically modulated optical device that uses the light-modulating properties of liquid crystals. Liquid crystals do not emit light directly, instead using a backlight or reflector to produce images in color or monochrome.[1] LCDs are available to display arbitrary images (as in a general-purpose computer display) or fixed images with low information content, which can be displayed or hidden, such as preset words, digits, and seven- segment displays, as in a digital clock.

- **The Temperature and PH sensor.**

To measure the temperature of a water tank and log it via the Arduino. The idea is to maintain the temperature of the water at 25-30C at all times. I've noticed that most applications have used a sensor such as DS18S20 or TMP35/TMP36/TMP37. but since my application requires to measure the temperature in water, I think a more suitable sensor should have a waterproof probe (or external probe).

The usual way is to contain the water inside a tank / container which can transmit heat – usually metal. To the outside of this is then bonded the temperature sensor – be that a simple bi-metallic strip thermostat, or a more complex temperature sensing transducer. Of course, this requires a metal tank, and that will radiate heat, which will be wasteful. Ideally you would want some form of waterproof probe. You haven't mentioned the amount of water you're dealing with – how big is the tank? How deep especially. There are thermocouples available in a rigid probe form – quite how waterproof these are I'm not sure, but these are never very long, so you won't be able to get it more than 6 inches or so into the water before you risk complete submersion.

• **The Turbidity Sensor**

Turbidity is an indicator often used to find the amount of suspended sediment in water. By cumbersome mechanical

sampling, it is possible to measure the concentration of suspended solids (in mg/l) in water, but turbidity is increasingly used instead, as it is easy to use and cheaper too. It is an ecologically important parameter as the various effects of suspended solids in aquatic ecosystems are due to their light scattering properties rather than their absolute mass.

5.3 User Stories

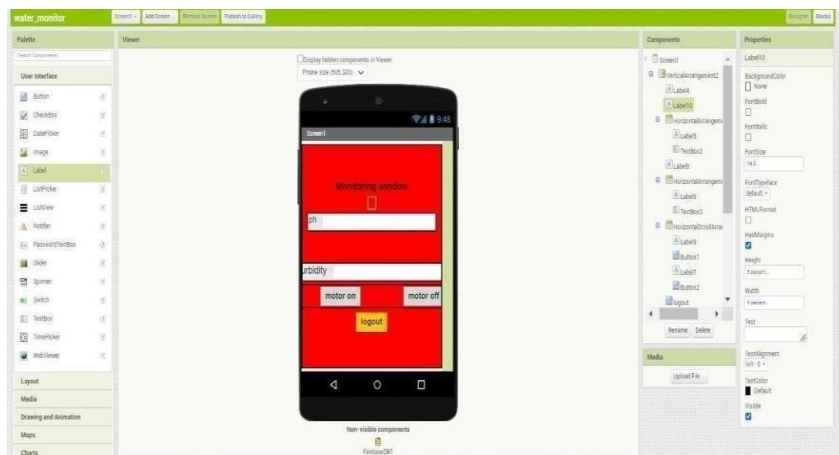

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer (Mobile user)	Registration	USN-1	As a user, I can register for the application by entering email, password, and confirming my password.	I can access my account/dashboard	High	Sprint-1
		USN-2	As a user, I will receive a confirmation email once I have registered for the application	I can receive e confirmation email & click confirm	High	Sprint-2
		USN-3	As a user, I can register for the application through Google	I can register & access the dashboard with Google	High	Sprint-1
		USN-4	As a user, I can register for the application through Gmail	I can register through the mail.	Medium	Sprint-2
	Login	USN-5	As a user, I can log into the application by entering email, password & captcha	I can receive login credentials.	High	Sprint-1
	Interface	USN-6	As a user, the interface should be user-friendly manner	I can able to access easily.	Medium	Sprint-1
Customer (Web user)	dashboard	WUSN-1	As a web user, I can access the specific <u>info</u> (ph value, temp, humidity, quality).	I can able to know the quality of the water.	High	Sprint-1
Customer Care Executive (input)	View manner	CCE-1	As a customer care, I can view data in visual representation manner(graph)	I can easily understand by visuals.	High	Sprint-1
	Taste	CCE-2	As a customer <u>care</u> , I can able to view the quality(salty) of the water	I can easily know whether it is salty or not	High	Sprint-1
	<u>Color</u> visibility	CCE-3	As a customer <u>care</u> , I can able predict the water <u>color</u> .	I can easily know the condition by <u>color</u> .	High	Sprint-1
Administrator	Risk tolerant	ADMIN-1	An administrator who is handling the system should update and take care of the application.	Admin should monitor the records properly.	High	Sprint-2

6.1 Sprint Planning & Estimation

TITLE	DESCRIPTION	DATE
Literature Survey & Information Gathering	Gather/collect the relevant information on project use case, refer the existing solutions, technical papers, research publications etc.	03 October 2022
Prepare Empathy Map	Prepare Empathy Map Canvas to capture the user Pains & Gains, Prepare list of problem statements	3 October 2022
Ideation	List the by organizing the brainstorming session and prioritize the top 3 ideas based on the feasibility & importance.	13 October 2022
Proposed Solution	Prepare the proposed solution document, which includes the novelty, feasibility of idea, business model, social impact, scalability of solution, etc.	13 October 2022
Problem Solution Fit	Prepare problem - solution fit document.	13 October 2022
Solution Architecture	Prepare solution architecture document.	13 October 2022
Customer Journey Map	Prepare the customer journey maps to understand the user interactions & experiences with the application (entry to exit).	19 October 2022
Functional Requirement	Prepare the functional requirement document.	19 October 2022
Data Flow Diagrams	Draw the data flow diagrams and submit for review.	19 October 2022
Technology Architecture	Prepare the technology architecture diagram.	19 October 2022
Prepare Milestone & Activity List	Prepare the milestones & activity list of the project.	15 November 2022
Project Development - Delivery of Sprint-1, 2, 3 & 4	Develop & submit the developed code by testing it.	IN PROGRESS..

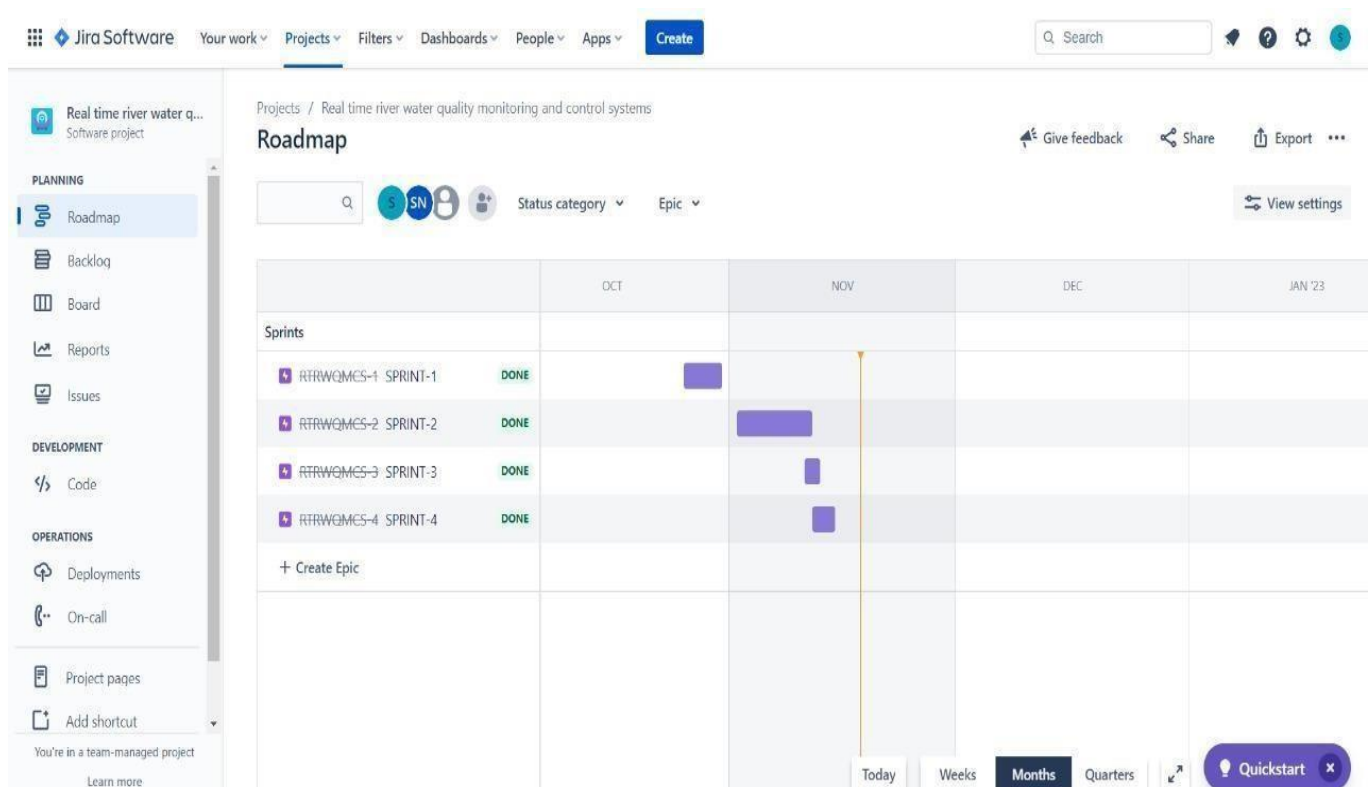

6.2 Sprint Delivery Schedule & Estimation

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

8. TESTING & RESULTS

- 8.1. Test Cases

Test case ID	Test case	Input	Output	Status
1	When the values of the parameters	Temperature=3,pH=3,Turbidity=404	ALERT! !THE WATER QUALITY IS DEGRA	Pass

are above the threshold value	DED			
2	When the values of the parameters are within the range	Temperature=45, pH=7, Turbidity=350	(no alert message is sent)	Pass

8.2 User Acceptance Testing

Defect Analysis Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal

9. ADVANTAGE

Benefits or Advantages of IoT based Water Quality Monitoring System

Following are the benefits or advantages of IoT based Water Quality Monitoring System are as follows.

- The boat is mobile in nature and hence large number of samples are easily collected from different locations in less time.
 - It is very easy to maintain the IoT based water quality monitoring system as all the electronic boards are available in the boat itself.
 - The system is very cheap as the hardware and software does not cost much.
 - Machine learning techniques have made it very easy to plot the data collected in various formats for proper analysis.
 - Cloud storage platforms such as adafruit, azure helps in storing the sensor data immediately and wirelessly to the robust servers.
-
- Based on a study of existing water quality monitoring system and scenario of water we can say that proposed system is more suitable to monitor water quality parameters in real time.
 - The River Water Management and Alert System built
 - on this architecture enable access, control and management of river water pollution.
 - The water quality parameters such as pH, Temperature, Turbidity can be monitored

DISADVANTAGES

- • There are no specific management plans or sanctions on water extractions in many areas, such as pumping groundwater or rivers. These have caused less water to be

soluble and even led to the mining of that resource in some respects. This hampers the water levels and increases the risk of contaminated water.

- • This paper focuses only on the pH, turbidity, temperature of river water here the other parameters such as conductivity is not considered.

- • The disadvantage of this system is, water is not monitoring seamlessly, and it always needs a human intervention.

CONCLUSION

An IoT system was developed to monitor river water in real time. The IoT system was used to collect the data from identified stations for different water quality parameters such as pH, turbidity, temperature and conductivity to generate a data set that was used to monitor the quality of water. The collected data set can also be used in future to make the system intelligent by applying machine learning techniques.

Real-time monitoring of water quality by using IoT integrated will immensely help people to become conscious against using contaminated water as well as to stop polluting the water. The research is conducted focusing on monitoring river water quality in real-time. Therefore, IoT integrated big data analytics is appeared to be a better solution as reliability, scalability, speed, and persistence can be provided

11..FUTURE SCOPE

In this proposed system we only focus on measuring the quality of river water parameters. This project can be extended into an efficient water management system of a local area. Moreover, other parameters which wasn't the scope of this project such as total dissolved solid, chemical oxygen demand and dissolved oxygen can also be quantified.
